In his review, Galaxy S7's main camera app is considered by most as one of the worst software available on Google Play.Q: Is the sum of all primes irrational? Let  $SP = \{p_1, p_2, \dots\}$  be the set of all primes,  $Sp_i \in P$ , and  $SP = \bigcup_{i=1}^{\infty} \{p_i, 2p_i, \dots\}$ . Is  $\sum_{p \in P} p$  irrational? I found the decimal expansion of  $\sum_{p \in P} p$  in the site and the decimal expansion of  $\sum_{p \in P} p$  does not have any 1's at any decimal digit after the third digit, which is consistent with irrationality. However, I can not find any irrationality proof. A: We have  $SP \subseteq \mathbb{Q}$ , and  $\mathbb{Q}$  is dense in  $\mathbb{R}$ . Hence,  $\sum_{p \in P} p$  is irrational. The answers so far are correct, but might be misleading. We can modify the sequence in question as follows: Let  $SP_k = \{p_1, p_2, \dots, p_k\}$ . This is just a proper subsequence of the original sequence. Now  $\sum_{p \in SP_k} p = \frac{(k+1)2^k}{k!}$ . Now note that  $SP = \bigcup_{k=1}^{\infty} SP_k$ .
